

1. Write a program using Object oriented programming and file handling.

1. Write a python program for the following:

Data is in salariedemployee.dat and contractemployee.data

salariedemployee.dat

12,kishori,training,Manager,1111

13,rajan,game,game designer,11111

contractemployee.dat

12,esha,insurance,Manager,12,1000.00

13,revati,ux,ux designer,111,1500.00

Using inheritance, Create classes as follows:

person ----id,name

employee : dept,desg (*person is a parent class*)

salariedemp : sal, bonus (20% of sal) (*employee is a parent class*)

contract: hrs worked , hourly charges (*employee is a parent class*)

If a file exists, read data from file, and store it in a list of employee objects and perform the following function on it.

- a) Add new Employee
- b) Delete employee
- c) Modify salary of employee
- d) Search employee
- e) Calculate Salary of Employee
- f) Display All
- g) Exit --- write all objects from list into file

Add calculateSal function in both classes

Formula for calculateSal for salariedEmp=

Da=10% of sal

Hra=15% of sal

Pf=8% of sal

Net sal=sal+da+hra-pf

Formula for calculateSal for contractEmp = hrs_worked * hourly charges
